

Overview

We're meeting tomorrow and I want everyone to try and build something in cursor. I want you to find some data or some spreadsheet that you can export to CSV and we can use to build a product.

What I need from you

Come up with something you want to create, you need a CSV file with column headers (this is your schema) then you need access to an LLM like Gemini or ChatGPT. Then, you need Cursor and Lovable Access.

This is enough to build an app.

Our Process

Steps we follow

Step 1 - Plan using ChatGPT (PLANNER LLM & REVIEWER LLM)

We plan our our prompt using ChatGPT. We research other products, and work on our Loveable Prompt. We ask ChatGPT to ask us questions and we want to get 50 to 100 questions answered.

Reviewer Interview Sessions

- [Alyson HR QA](#)
- [Alyson Projects & Tasks QA](#)

***** Important ***: Send this to Bill or appropriate architect for approval and review.**

Step 2 - Schema Alignment on ChatGPT

We then upload our sample data from our “unified” tables and we then update the prompts in ChatGPT with actual tables with sample data. Normally, the unified tables and schema we have are missing things that are new so those need to be identified as “new tables” and if it’s “source” data, we need to add to unified. If tables are relate to the app, we need to add to the app and identify these are missing tables.

Step 3 - Build on Lovable

We send Lovable the prompt from ChatGPT and we upload (1) brand guidelines and UI guidelines (2) the ChatGPT prompt with sample schema.

- [Alyson Brand Guidelines](#)

Step 4 - Video the Lovable App using screen recording, send to ChatGPT

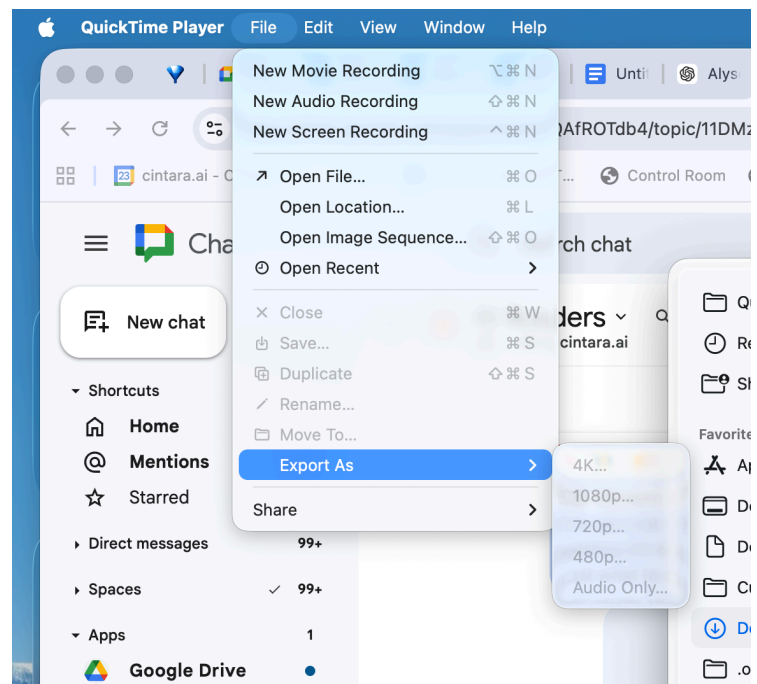

We have ChatGPT “review” and audit the app. We export a video and we can compress the video before sending. Usually best under 50 MB. ChatGPT will generate a new loveable prompt and fix problems.

We do this 3-4 times until we have a good UI that ChatGPT likes.

If the video is a problem, are you using a paid account?

Two things you can do

- The first thing is to compress the file. Did you login to the cursor and compress?
- Second, its export a lower FPS (frames per second) and that acts like a compression.

The best is to do both but compression reduces it 90% and frames per second is 50% in my experience so compression matters more.

Step 5- collaborate with team.

Share and get ideas.

Step 6 - push final UI to GitHub then connect to GitHub repo

We don't need front end engineers to build UI. We just push to our GitHub Repo. Then, we use Cursor or Claude code to build the backend APIs in Node and then if needed we work with data engineering to get the "missing" source data onboarded.

Access to AI Tools

I've asked Mohita to provide you with shared team level accounts for the following tools. Please confirm you have access to the following tools for you and your team. If you do not, ask Mohita and others on your team for access to these tools.

Every team should have one account to the following tools and the "super users" who are actually getting product built and deployed, can get their own subscriptions.

For planning our your prompts

- ChatGPT Pro
- Gemini Pro

For UI and Design

- Lovable

For coding & Connecting to Github Repo

- Cursor
- Claude Pro
- Codex - you can try this.

Sample Products

Below are examples of products created in the past week that we are now working on.

[Alyson HwR](#)

A tool for managing our human resources functions and most of all, for helping motivate our teams.

[Alyson PM](#)

Product manager for all teams starting with the data engineering team that will write loveable and cursor prompt for all stories in our roadmap.

[Alyson Acquire SEM](#)

SEM tool for our Acquire team.

[Alsyon CDP: Identity Engine](#)

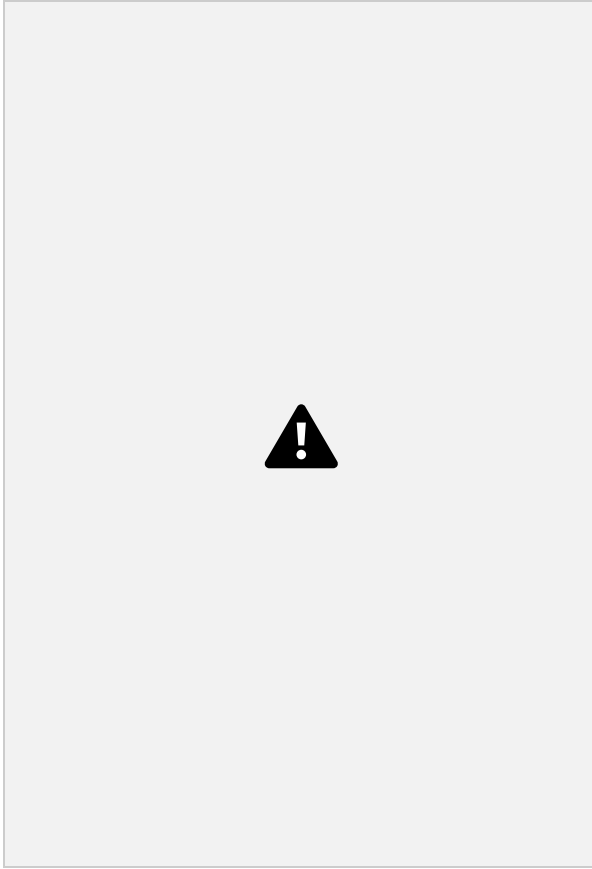

A full identity engine and audience builder tool.

[Alyson Projects and Tasks](#)

An add on to our experiment product allowing a user to view projects and tasks associated with a user.

Alyson Talent - no UI Yet

Alyson Talent a platform with a chrome browser plugin for talent team to analyze linkedin profiles in real time.

Alyson Schema Analyzer - no loveable UI
