

no need to focus on the training phase, focus on the evaluation and the test must be accessible in both online and offline mode.

in the case where the candidate is remote, ask them to share their screen and ask to solve the test

also be able to assign some in-person assignments to evaluate the new joiner for like 1hour - 1:1 work for evaluation

focus on PM skills and project based evaluation not just testing skills, personality = 60%

☰ Alyson Training Project Understanding - Vinit

Q&A 1 Link: I will provide it as soon as the planning doubts are clarified.

1. W R Prashansa Chauhan Garima Singh Mohita Yadav Can you share with me the major issues that caused the failure last time?

No tests were taken, no learning occurred. No grades were shared, and that avg person got a 100% which means they all cheated on the assignment.

Testing Issues

So, the new process must not use a computer for testing, we need a simple user interface, and we need reports and we need some summary. The goal should be that 25% of the people fail the test the first time and have to repeat it. So, we need to monitor that result.

The tests should also be interactive so a user can send feedback on bad questions or contribute a question that they think we should ask.

There should be some written aspect where there is a 100-200 word answer that is typed that is required since that makes it harder to cheat.

Tests should be paper based for final exams or done on a computer. For practice, we want a computer test and then for the “final” we want that done on paper.

There was also not regular reporting so as CEO, I did not know what was occurring so I want me and the manager to get emails when a test is taken and CC the candidate.

Interviews

We also want to create tests for interviews of candidates. We want to test their personality, IQ and reading and writing skills.

Recruiter should also be able to share screen and deliver the test and make sure someone is not cheating.

In Person 1:1 Training with Team

We should also be able to assign 1:1 meetings with team to a new hire so they work with team and the team trains on a topic then does a test.

Class Creation

A Creator needs to be able to:

- Add video
- Add transcript from a training to get LLM to generate questions
- Questions should be multiple choice and essay.
- Grading should be prob 50% multiple choice and 50% essay.
 - We can probably do the essay on a computer.
- Need a human feedback loop on questions so we can as a creator take a test and “delete” “change” or “add” questions.

Onboarding Manager

We also need to manage some basic tasks for onboarding like “setup a computer” or “meet with Bill” or “meet your manager” etc and that’s important to think through.

2. W R Prashansa Chauhan Garima Singh Mohita Yadav How should the learning path differ between Engineering, Customer Success, Affiliate Sales, HR, and Product roles? I'm concerned about keeping the sections different which will be role specific.

Start with the ability to assign a "course" which is a group of classes or a class to a user. Then, we could have a "role based" class setup where based on your role you are required to take some classes. It should be drag and drop to create this.

3. W R What should a new joiner experience from Day 0 to certification? I am not getting the idea of certification as, If they are employees and do want to get qualified whether they are good or not to survive, scoring is enough right?

Certified just means that they got an 80% or more on their assigned classes and we want this done in 2 weeks at most. Preferably, 1 week so we need to track "speed" and "completion rate"

4. W R Please explain what specifically needs to be displayed on the dashboard ? I think of displaying the normal stuff like highest scoring employees, department wise scores, progress report, etc.

Dashboard should show:

Candidates in good standing

Candidate "with concerns" who are not on track to finish on time or have low test scores.

I should be able to search a name and see the candidate performance and a "report card"

5. W R can you confirm what style should we follow in this LMS platform:

A. Udemy style - Sections Dropdown and items listed topic-subtopic wise

B. Blog style - topics are explained in the form of blogs which are inspired by the transcripts of lectures/recordings.

C. Blog + Youtube & Reference links

Udemy - and make sure you use our brand guidelines. Serve video from S3.

6. W R What do you suggest on how the LMS should support versioning of manuals, recordings, assessments, and questions? Like I was thinking of listing the youtube videos and drive links directly. For the assessments i was thinking on adding a smart LLM layer of 2 stage processes to ensure the questions are not repetitive and are unique:

Shuffle topics with an algorithm => Ask LLM to generate questions and quizzes on it!

Udemy - and make sure you use our brand guidelines.

7. W R Which one will be good enough either, to take quizzes at the end of each chapter or each section?

Practice - we should have a test only. People can take it in "Practice" mode or "Final" mode and we just let them take tests.

8. W R Prashansa Chauhan Garima Singh Mohita Yadav Will there be any need of updating or modifying the videos? As if the videos need to be modified further, manually changing the drive link to the current video's link, this replacement will be hard and if there is no specific focus on uploading the videos we can do it easily just by replacing the old youtube or blog links to new ones.

yes

9. W R What fact tables and dimension tables should exist for LMS analytics?

See dashboard above but main thing is who is succeeding, who is failing, and maybe who is the best.

10. W R How should training data be structured for pivot-table analysis? Please explain the entire monitoring system that needs to be there in the system.
11. W R How should printable assessments be generated securely? Like just state how the entire process will be carried out?

12. W R Prashansa Chauhan Garima Singh Mohita Yadav I'm really concerned about the metrics that will prove the employee is good enough or not?

I was thinking of giving a scoring of 75% as per the specific role they are training on.

13. W R What happens if a person fails for the first time? Is there a need for a monitoring system ?

re-take

14. W R After the pen-paper evaluation test is given to the employee, how should the checking of this exam papers be checked? Should it be manually or digitally? The problem with digitally is that there will be an extreme amount of LLM calls so to tackle this, if clean images are uploaded then only the mapping can be done by image similarity.

We should upload screenshots from a camera on a phone then LLM will grade the exam and so we need an interface for the "test administrator" to upload images then grade them and the LLM needs a "grading rubric" that they will use to grade things.

15. W R After scoring the employees, what should be the strategy of getting back to each new learner about their scores? I was thinking of doing this manually and teaching them by pointing out their mistakes manually. If this is done digitally, it should be forwarded on the LMS platform with a report

If someone does not pass, we have to take action and probably let them go since we can't have an employee fail training. They can re-take it but they have to pass everything within 30 days or we need to terminate them. The goal should be 7 days, 14 days is a warning, 30 days we probably need to pause them or terminate and this need to be escalated to the CEO.

16. W R How about a chatbot at one end of the screen and anyone who feels like asking doubts can ask a chatbot who has been trained on the RAG Database of our knowledge?

Skip this for now - we're building Alyson PM and that has these components.

17. W R Please review my version of architecture :

I will follow this along in order to create the full stack LMS platform, chunk by chunk.

18. Please suggest a paper pattern that can be effective, such as:

Competency	Question Count	Difficulty
Culture & handbook	10	Easy/Medium
Product basics	15	Medium
Tools & workflow	10	Medium
Role-specific process	20	Medium/Hard
Compliance/security	10	Medium
Scenario judgment	5	Hard
Practical task	1	Applied

I'd like to see 25-50 questions on a test - assume 1 minute per question and then make sure it's 50% multiple choice, and 50% essay. We need to see their writing skills above all.

19. W R Please give me any architecture or suggestion you have in mind for future scope.

I think we want to just start this in a RDS database or simple low cost database.

20. W R Prashansa Chauhan Garima Singh Mohita Yadav What manual operations are still acceptable and what must be automated in this process ?

21. W R How do we handle the Trainer bottleneck ?
