1. We need Google SSO so we can sign in with our cintara.com domain.
2. We need an invite features so only people who are invited can login and see courses. If not invited, you cannot see anything.
3. Create a class. I think this should be a LLM chatbot experience. So, first thing is the AI says "Upload your docs or tell me what kind of class you want to create" and then if we upload docs, it proposes the name and title and so on so we can reduce the work the user has to do on this. I think if it's easy, people will do it and if it's time consuming, they will not. BUT I would leave the UI The same, just add a AI interface that fills out the UI. The topics should be read from the doc, and the user just confirms them. So, maybe the first step is a chat with a LLM. You can use this DeepSeek API Key. sk-7afa23a01a1f40778563afe67ac0bda3
4. When we assign a new user their test, they should have a max of 2 weeks from assignment date to complete it.
5. We need some reporting on users who didn't complete assignments on time. And we need some email program from a training email account that emails them to finish their work and I think every day if they have open assignments, they should have an email they get to complete the assignments.
6. check the font size, font size should not be less than 12.
7. Mobile responsive - for training, we want this to work on mobile phone so when you're done make sure it's mobile.
8. Courses - this is not a good UI. When I login to a course, it should be like cards with information and maybe a quiz every 5-10 cards of knowledge. Perfect for mobile device. User clicks on a course, and the cards open up and take over the screen and I can see the text and scroll and finish a card then the next topic starts. I think this is a better UI.
9. Course UI looks weird --- this looks like a CREATOR login. When I'm in creator mode, at bottom left it should say "Creator mode" and when I'm in student mode it should say "Student mode" and in creator mode, I can edit things. And there's an edit button. This looks wrong and I'm not sure what is happening. Font in the course section are too small also, never below 12 point.

10. Users - I'd say add in the manager, add in the team and then add in some metrics: Maybe there's

- Are they on track or not to finish on time?
- Avg score
- Ranking based on test score.
- % assignments complete
- % late
- training role: creator or student or admin
- HR Person assigned to them

11. Analytics - make sure the analytics answer the problems we expect

- Who is not a good hire and failing
- who is behind schedule and their manager and HR Lead need an email
- we need some info about the emailing since we need to confirm the emails are working and going out.
- Tests that are bad based on % of questions marked bad by student
- Questions that are bad.
- Tests that are too easy - like everyone gets a 100%
- Top Performers - list of all test takers by score.
- Not studying - people not logging in or not studying.
- Study Effort - how many "Cards" did they read ... we can use that to measure study time probably.

What other problems do you expect that we should report on.

Alyson LMS Platform – Admin Panel Documentation

1. Overview

The Admin Panel is a **full-stack management interface** for Alyson LMS, designed to:

- Manage **courses, classes, sections, and role-based assignments**
- Integrate **LLM-assisted workflows** for class creation and automated question generation
- Include **role-based test assignments** with a question randomizer and essay scoring
- Provide **real-time analytics, dashboards, and reporting**
- Be **mobile-responsive** and fully compliant with **Alyson Brand Guidelines**

This platform is structured to allow **future integration with Trainee Panels**, analytics pipelines, and AI-driven assessment.

2. Step-by-Step Features Implemented

Step 1 – Google SSO & Invite-Only Access

- Users can log in using **@cintara.ai** domain via Google SSO.
 - Invite-only access ensures only approved users can access courses.
 - Role is automatically assigned from invite metadata.
 - Schema updates (invite token, SSO flag, role mapping) applied only if necessary.
 - Brand-compliant login UI implemented (colors, typography, spacing).
-

Step 2 – Role-Based Course Assignment

- Admins can assign courses based on **user role** (Data Scientist, PM, Marketing, etc.).
 - **Udemy-style course display**: Section → Topic → Subtopic.
 - Drag-and-drop interface for reordering sections and modules.
 - Courses assigned appear on **Trainee Panel** automatically.
 - Lovable JSON/DSL updated for role-based assignments.
-

Step 3 – LLM-Assisted Class Creation

- AI chatbot interface integrated for creating new classes:
 - Admin uploads docs or describes class → LLM proposes class name, description, and topics
 - Admin confirms or edits suggested topics
 - DeepSeek API used for parsing documents
(**sk-7afa23a01a1f40778563afe67ac0bda3**)
 - Auto-fills course info while retaining current Admin UI layout.
-

Step 4 – Test Question Randomizer Integration

- Embedded **existing test platform** from demo video for randomized MCQs + essay questions.
 - Assign tests to learners with **2-week completion window**.
 - Retakes are automatically tracked if a learner fails.
 - Fully integrated with **Admin dashboards** and metrics panels.
-

Step 5 – Reporting & Email Notifications

- Reporting panels show learner metrics:
 - Completion %, overdue tasks, average scores, rankings, HR person assigned
 - Daily automated emails notify learners with pending assignments
 - Alerts escalate to Admin/CEO when overdue persists
 - UI and cards fully **brand-compliant** and mobile-responsive
-

Step 6 – Dashboard Enhancements

- Dashboard metrics include:
 - Learners at risk / not on track
 - Top performers
 - Questions flagged as bad
 - Tests that are too easy
 - Study effort (# cards read, time per card)
 - Metrics displayed in **modular cards and charts** using accent blue (#3B82F6)
 - Real-time updates integrated
-

Step 7 – Creator / Student Mode Toggle

- Mode toggle displayed bottom-left: **Creator Mode / Student Mode**
- **Creator Mode:** edit courses, add sections, manage assessments
- **Student Mode:** view-only access
- Font size **≥12pt**, fully mobile-responsive

- Mode persists across sessions
-

Step 8 – Additional Feedback Updates

- Google SSO, invite-only, LLM-assisted class creation, test platform integration fully combined.
 - Email notifications for overdue assignments integrated.
 - Role-based course assignments and analytics fully functional.
 - Mobile-responsive course cards for students (scrollable, one card at a time, quizzes every 5–10 cards).
 - Creator/Student mode toggle implemented.
-

3. UI / UX Compliance

- Sidebar (240px) + Main content
 - Modular card layout: white, rounded corners 12px, subtle border (#E5E7EB), padding 16–20px
 - Accent color: #3B82F6 for buttons, highlights, charts
 - Typography: Inter; page title 24px semi-bold, section headers 16px medium, metrics 28px bold, labels 12pt muted grey
 - Minimalist graphs: sparkline style, thin accent lines, soft gradient fills
 - Mobile-responsive design for all panels
-

4. Integration & Backend Preparedness

- Backend APIs ready for:
 - Role-based course assignments
 - Test randomizer + LLM question bank
 - Automated essay scoring

- Progress tracking and analytics
 - Email notifications and escalations
 - Schema updates applied only if necessary to support new features
 - Prepared for **future integration** with Trainee Panel
-

5. Next Steps / Pending Enhancements

- Step 9: Trainee Panel UI (auto-reflection of courses, LLM blogs, assessments)
- Further testing for **mobile devices** and cross-browser compatibility
- Complete **full-stack connection**: Admin → Backend → Trainee Panel → Analytics dashboards
- Optional: add **real-time LLM feedback for trainees**, push notifications, and predictive metrics
